

PLS8

On large scale installations it is recommended to place a booster with multiple outputs on center stage and split the DMX lines starlike. This reduces the length and load of every single line. But keep in mind to use only special, shielded DMX cable and select shortest cable runs, and keep DMX cables away from power supply and load cables of dimmers.

SPECIFICATIONS

Universal DMX512 splitter

Extra input to connect next splitter

Electronic isolation between input and output

DMX input and output (3pin or 5pin)

Each DMX output can drive up to 32 loads

Indicator lights for each output
